PostgreSQL Tutorial

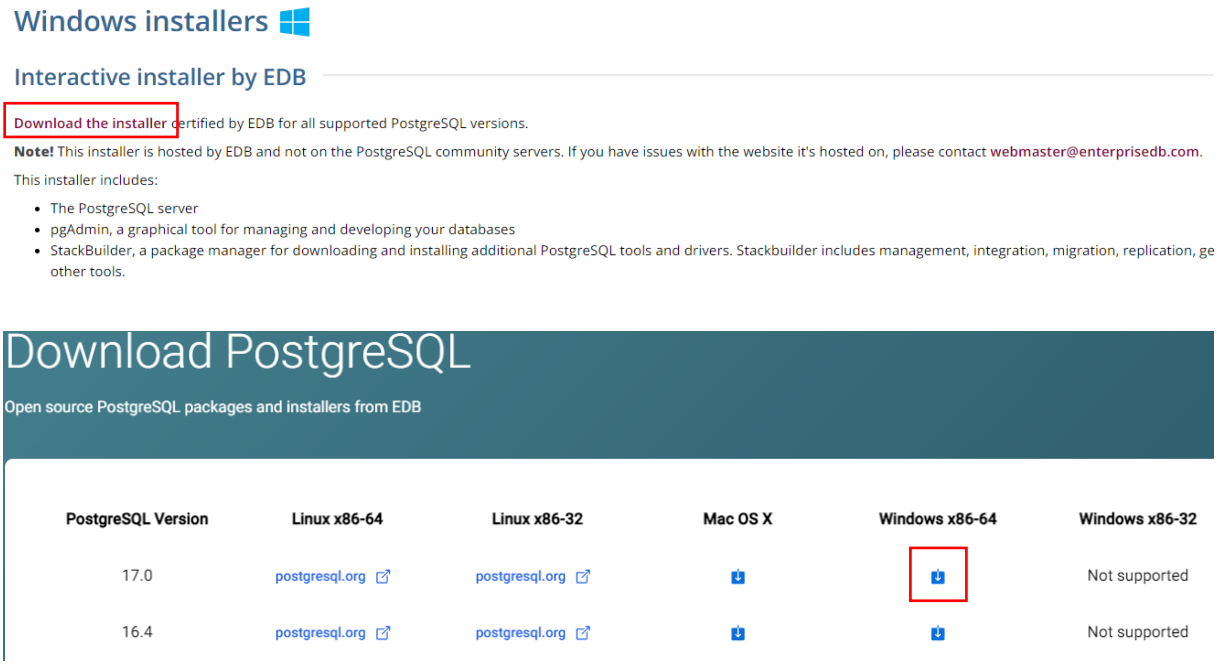

Installation

This tutorial walks you through the download and installation process of PostgreSQL. Here, we focus on the Windows installation process. However, PostgreSQL versions for other operating systems exist, e.g. MacOS and Linux.

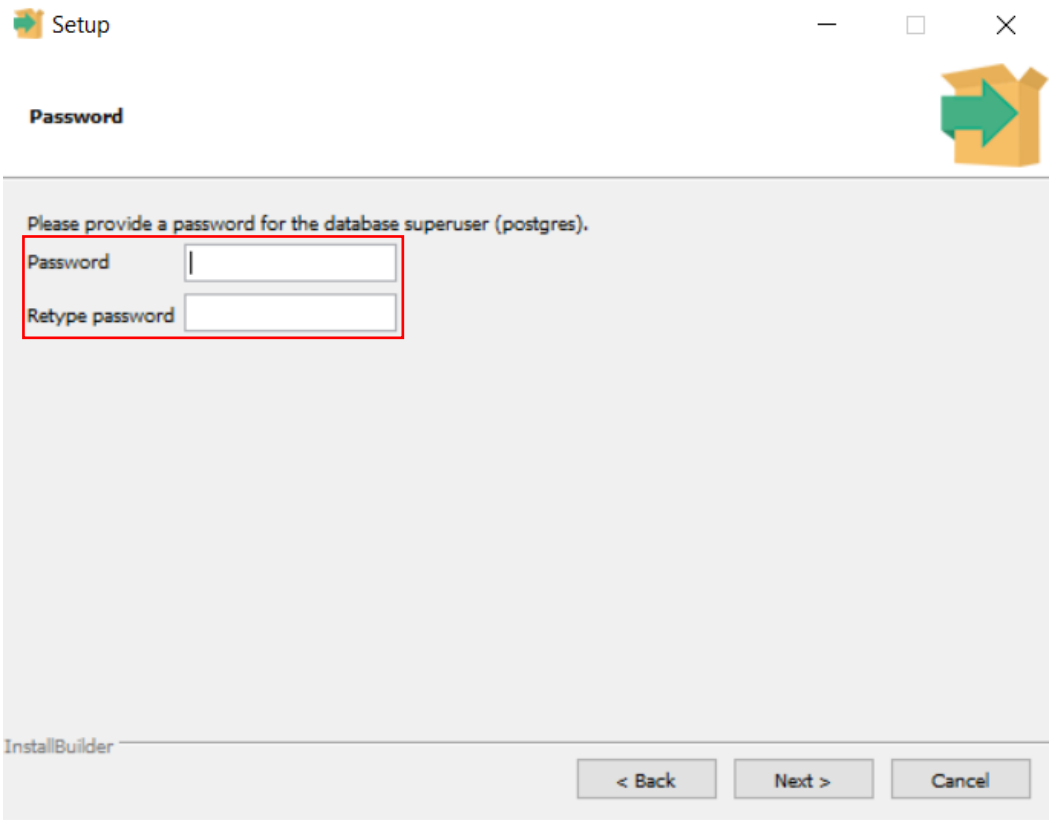

1. Open https://www.postgresql.org/download/ and download the appropriate installer for your operating system.

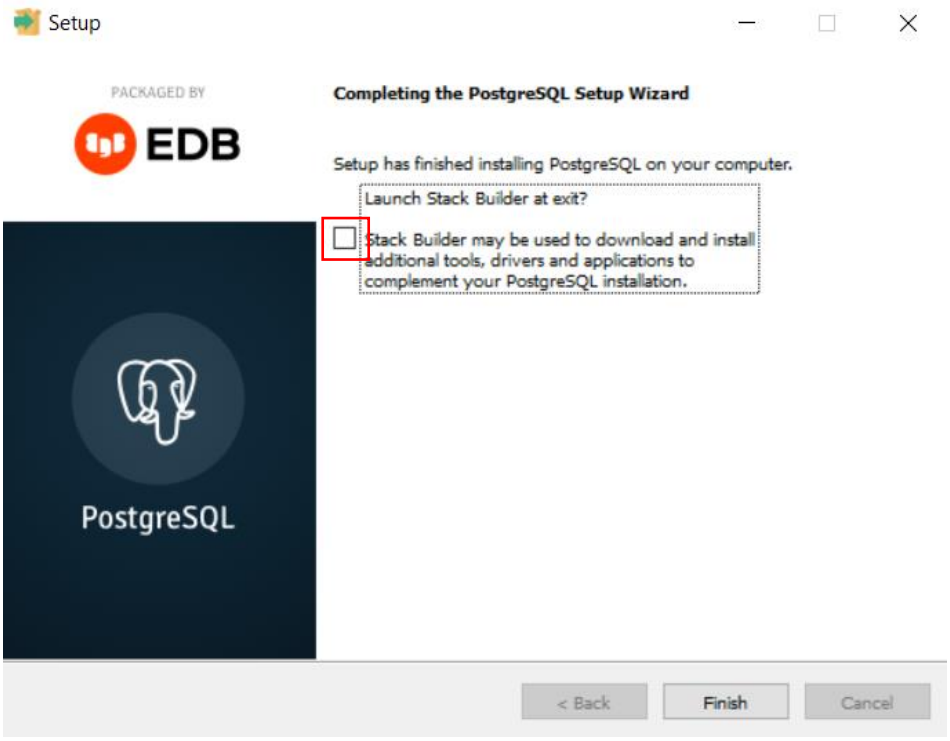

2. Click on "Download the installer" to proceed to the next page where you can select the newest PostgreSQL version (in this case, i.e., Version 17.0 for Windows x86-64).

3. After the download is completed, open the installer (if possible, with admin rights) and click "Next" until the installer asks for your password. Please do not change any default values during these steps.

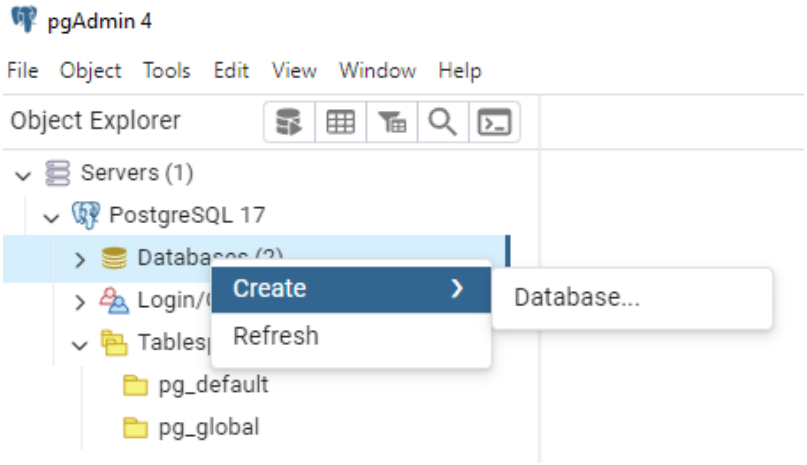

4. Select any password you can remember easily **(This is important!)**. Then click “Next” and wait for the installation process to finish (this may take a few minutes).

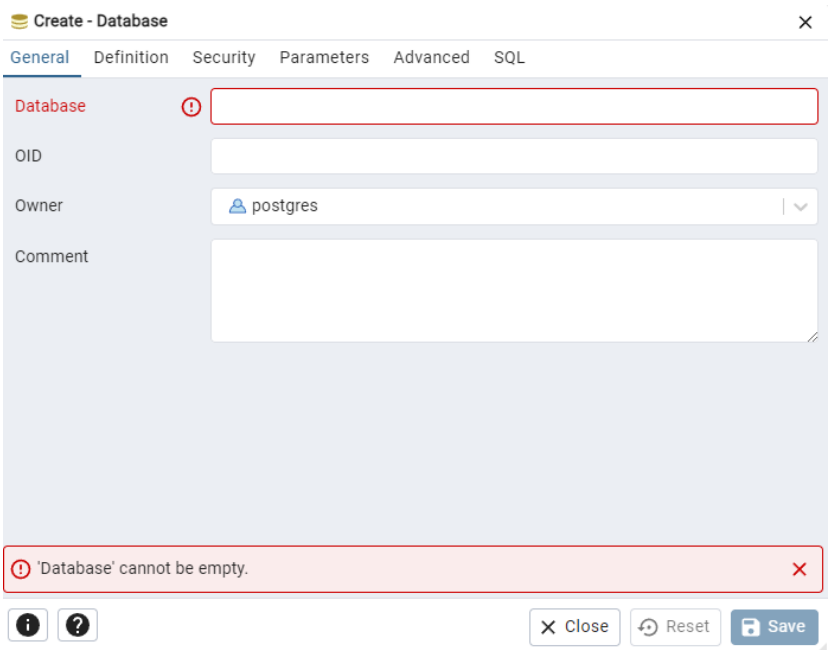

5. Un-select “Launch Stack Builder at exit?” and click “Finish”.

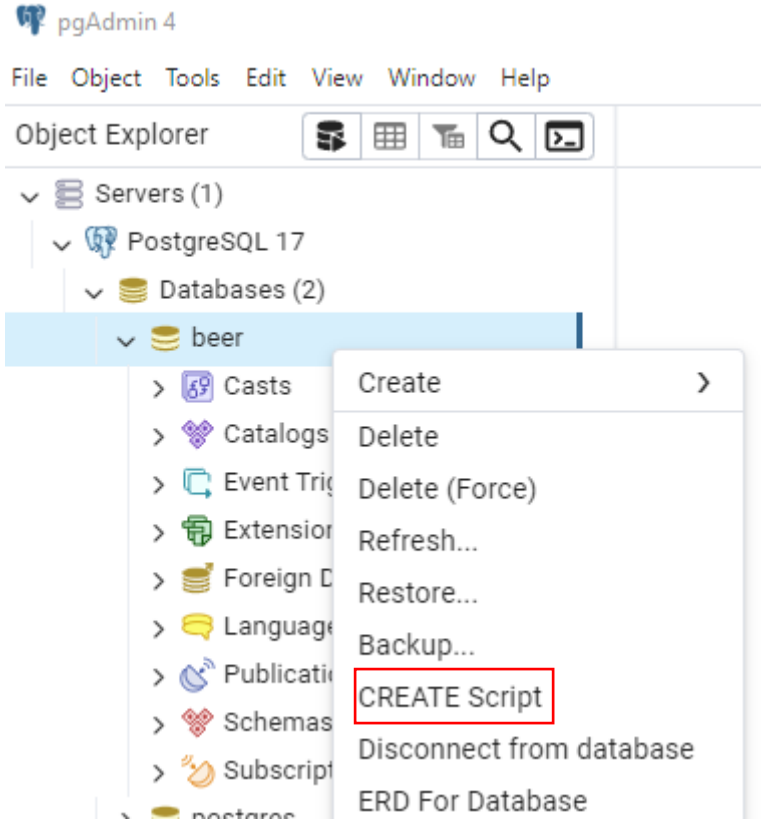

First Steps

1. After following the previous steps, you can now use PostgreSQL. Here are some tutorials that can make your life easier.
    a. https://www.postgresqltutorial.com/
    b. https://www.tutorialspoint.com/postgresql/index.htm
2. To create a schema, open pgAdmin and click on Servers → PostgreSQL → right-click on Databases → Create → Database. Please define a name for the database in the field "Database"

3. Right-click on the new database and select “CREATE SCRIPT”

4. Now, you can type in your queries for creating the tables in the database, loading the data into the tables, and performing queries. The most important buttons are marked in red: saving and loading previously saved scripts (left) and executing the script/queries (right).
